

# EOK-Heavy Truck& Trailer Shock Absorber Catalog

**EOK SPECILIZE IN TRUCK&BUS  
SHOCK ABSORBER MORE THAN  
20 YEARS**

# SHOCK ABSORBER COMPONENTS

THE SHOCK ABSORBER CONSISTS OF THE FOLLOWING COMPONENTS:

- 1 Upper Attachment Lug**
- 2 Sealing**
- 3 Guide**
- 4 Piston Rod**
- 5 Hydraulic Oil**
- 6 Operating Cylinder (Reserve Cylinder)**
- 7 Outer Cylinder**
- 8 Piston Valve**
- 9 Bottom Valve**
- 10 Lower Attachment Lug**

**IT IS RECOMMENDED THAT THEY BE CHANGED AS A PAIR**

## All About Shock Absorbers

# SHOCK ABSORBER HOW IT WORKS

- Unless a dampening structure is present, a truck's leaf springs will extend and release the energy it absorbs at an uncontrolled rate – and continue to bounce at its natural frequency until all of the energy is used – making for an extremely bouncy ride and an uncontrollable truck.
- A shock absorber controls that unwanted leaf spring motion – a process known as dampening. **Shock absorbers slow down and reduce the magnitude of vibratory motions** by turning the kinetic energy of suspension movement into heat energy that can be dissipated through hydraulic fluid.
- A shock absorber is basically an **oil pump placed between the chassis frame of the truck and the axle**. The upper mount of the shock connects to the frame (sprung weight), while the lower mount connects to the axle (unsprung weight).
- **A twin-tube design**, the upper attachment lug is connected to a piston rod, which in turn is connected to a piston – which sits in a tube filled with hydraulic fluid. The inner tube is known as the pressure tube, and the **outer tube** is known as the reserve tube. The reserve tube stores excess hydraulic fluid.
- when the truck's wheels encounter a bump in the road the energy of the leaf spring is transferred to the shock absorber through the upper attachment lug, down through the piston rod and into the piston. Orifices perforate the piston and allow fluid to leak through as the piston moves up and down in the pressure tube. Because the orifices are relatively tiny, only a small amount of fluid, under great pressure, passes through. This slows down the piston, which in turn slows down the spring.

## SHOCK ABSORBERS WORK IN TWO CYCLES

### 1: Compression Cycle

The compression cycle occurs as the piston moves downward, compressing the hydraulic fluid in the chamber below the piston. During compression the fluid is pressed partly through the bottom valve to the outer cylinder and partly through the piston valve to the area above the piston. In this case the size of the damping force is mainly determined by the bottom valve. Since the ducts are very narrow a resistance builds up against the fluid flowing through. In this way the movement of the piston is braked. In the event of a sudden compression or extension the braking effect is increased further by means of swirl formation in the fluid flows through the ducts. The compression cycle controls the motion of the vehicle's unsprung weight.

## EOK-Shock Absorber for Hevery Truck&Trailer

### 2: Extension Cycle

The extension cycle occurs as the piston moves toward the top of the pressure tube, compressing the fluid in the chamber above the piston. During extension the fluid is pressed into the area above the piston through the piston valve at the same time as fluid from the outer cylinder is drawn through the bottom valve. In this case the size of the damping force is mainly determined by the piston valve. The shock absorbers have a hydraulic brake device that starts to operate approx. 15mm before they are fully extended. The extension cycle controls the heavier-sprung weight. All modern shock absorbers are velocity-sensitive – the faster the suspension moves, the more resistance the shock absorber provides. This enables shocks to adjust to road conditions and to control all of the unwanted motions that can occur in a moving vehicle, including bounce, sway, brake dive and acceleration squat.

### 3: The right characteristic

It is important for comfort and road holding that the shock absorber characteristic is correct. This means that the shock absorber must have the correct resistance and rate of expansion and compression. Renault Trucks has carried out tests to determine which shock absorbers are best suited for different spring options. **When changing shock absorbers, always use the type originally fitted to the vehicle.**

### 4: Heat-resistant seals and oil

Shock absorbers become very hot in use. It is important that the seals are not damaged by the heat, since they must keep out dirt and dust at the same time as preventing the oil from leaking out. Genuine Renault Trucks shock absorbers therefore have seals made of Viton, a highly heatresistant material – which **can withstand temperatures of 180°C to deliver longevity**. The oil in the shock absorbers must also be heatresistant. In Genuine Renault Trucks shock absorbers, an exact quantity of high-grade hydraulic oil is used. The damping properties are maintained because the oil does not boil or evaporate prematurely.

### 5: Bushing

**High strength flexible rubber bushing** – accommodating for misalignment in axle and chassis movement contributing to a smoother ride.
